

GROOM/STICK – SAFETY DATA INFORMATION

We do not publish safety data on this product. Groom/stick is a simple product comprising natural rubber with a small amount of titanium dioxide to lighten the colour and improve the visual quality. The rubber is milled continuously under great pressure for a long time until it becomes very soft and sticky. It retains its tack for several years and absorbs foreign matter on contact.

The precise production process is a trade secret. In normal use as a paper and surface cleaner, the product has no known adverse effects on skin and does not produce bad odour or fumes to cause breathing problems. Used material, which has become dry from excessive amounts of absorption during normal work sessions, can be discarded by normal disposal methods.

In normal storage conditions Groom/stick has a long shelf life, of at least five years.
